

# Locals in Terraform?

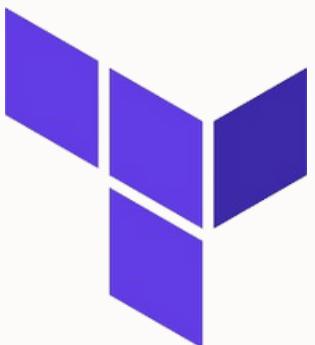

- locals are like temporary variables used inside your code
- They make your code cleaner, reusable, and more readable
- They are not passed as input (like variables), but defined & used locally.

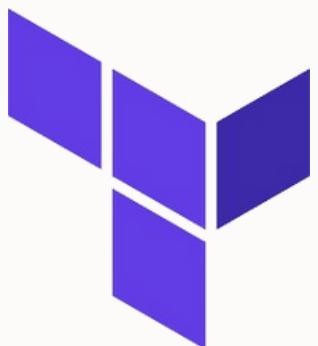

# Why use locals?

- Avoid repeating long values again and again
- Centralize logic (e.g., tags, naming patterns)
- Combine multiple values or results.

# What is a Conditional Expression?

- It's like an if-else in one line
